Visual Display Responding to Eye Movements

temperature - visual - binaural-auditory
binaural-auditory - visual - temperature

fovea vision

2 degrees at the
centre of the visual
field;
responsible for the
sharp detailed sight

parafoveal vision

2-10 degrees off
centre;
responsible for
low resolution
compressed
information

**periphe
ral field**

>10
degrees
off
centre

The Anatomy of the Eye

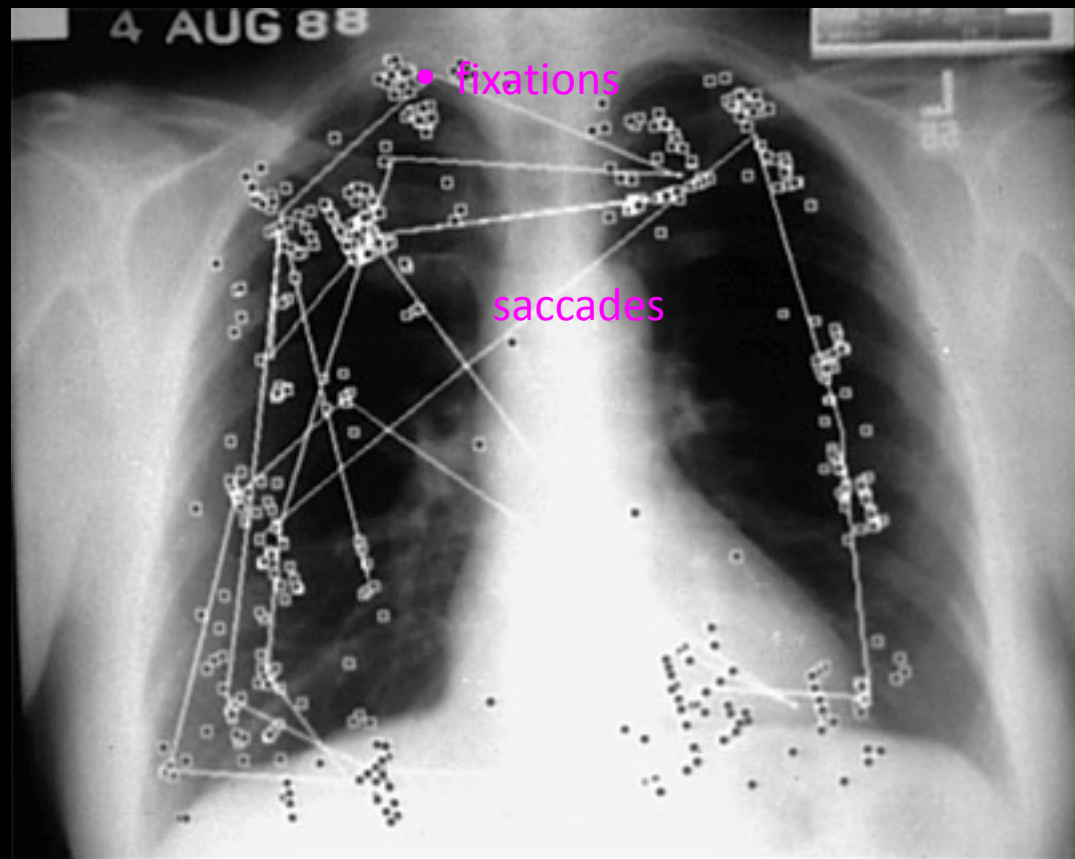

Since the visual field cannot be processed from one single fixation, rapid eye movements are necessary to bring the retinal image of an object of interest to lie on the fovea .

VOLUNTARY

- fixation
- smooth pursuits
- saccades

INVOLUNTARY

- micro-saccades
- blink

Expert judges review scan patterns of an Xray

Eye Movement Research and Aesthetics

Relationship between the viewer's eye movement and viewing act of art

...methods often reduce the viewer's act to a mechanistic agency

ScanPath

static image of the viewer's eye movement which is recorded and visualised as sequence of fixations and saccades

Yarbus' Scanpath Research

composition that guides the viewer's eye on a pleasing path of visual elements of the scene

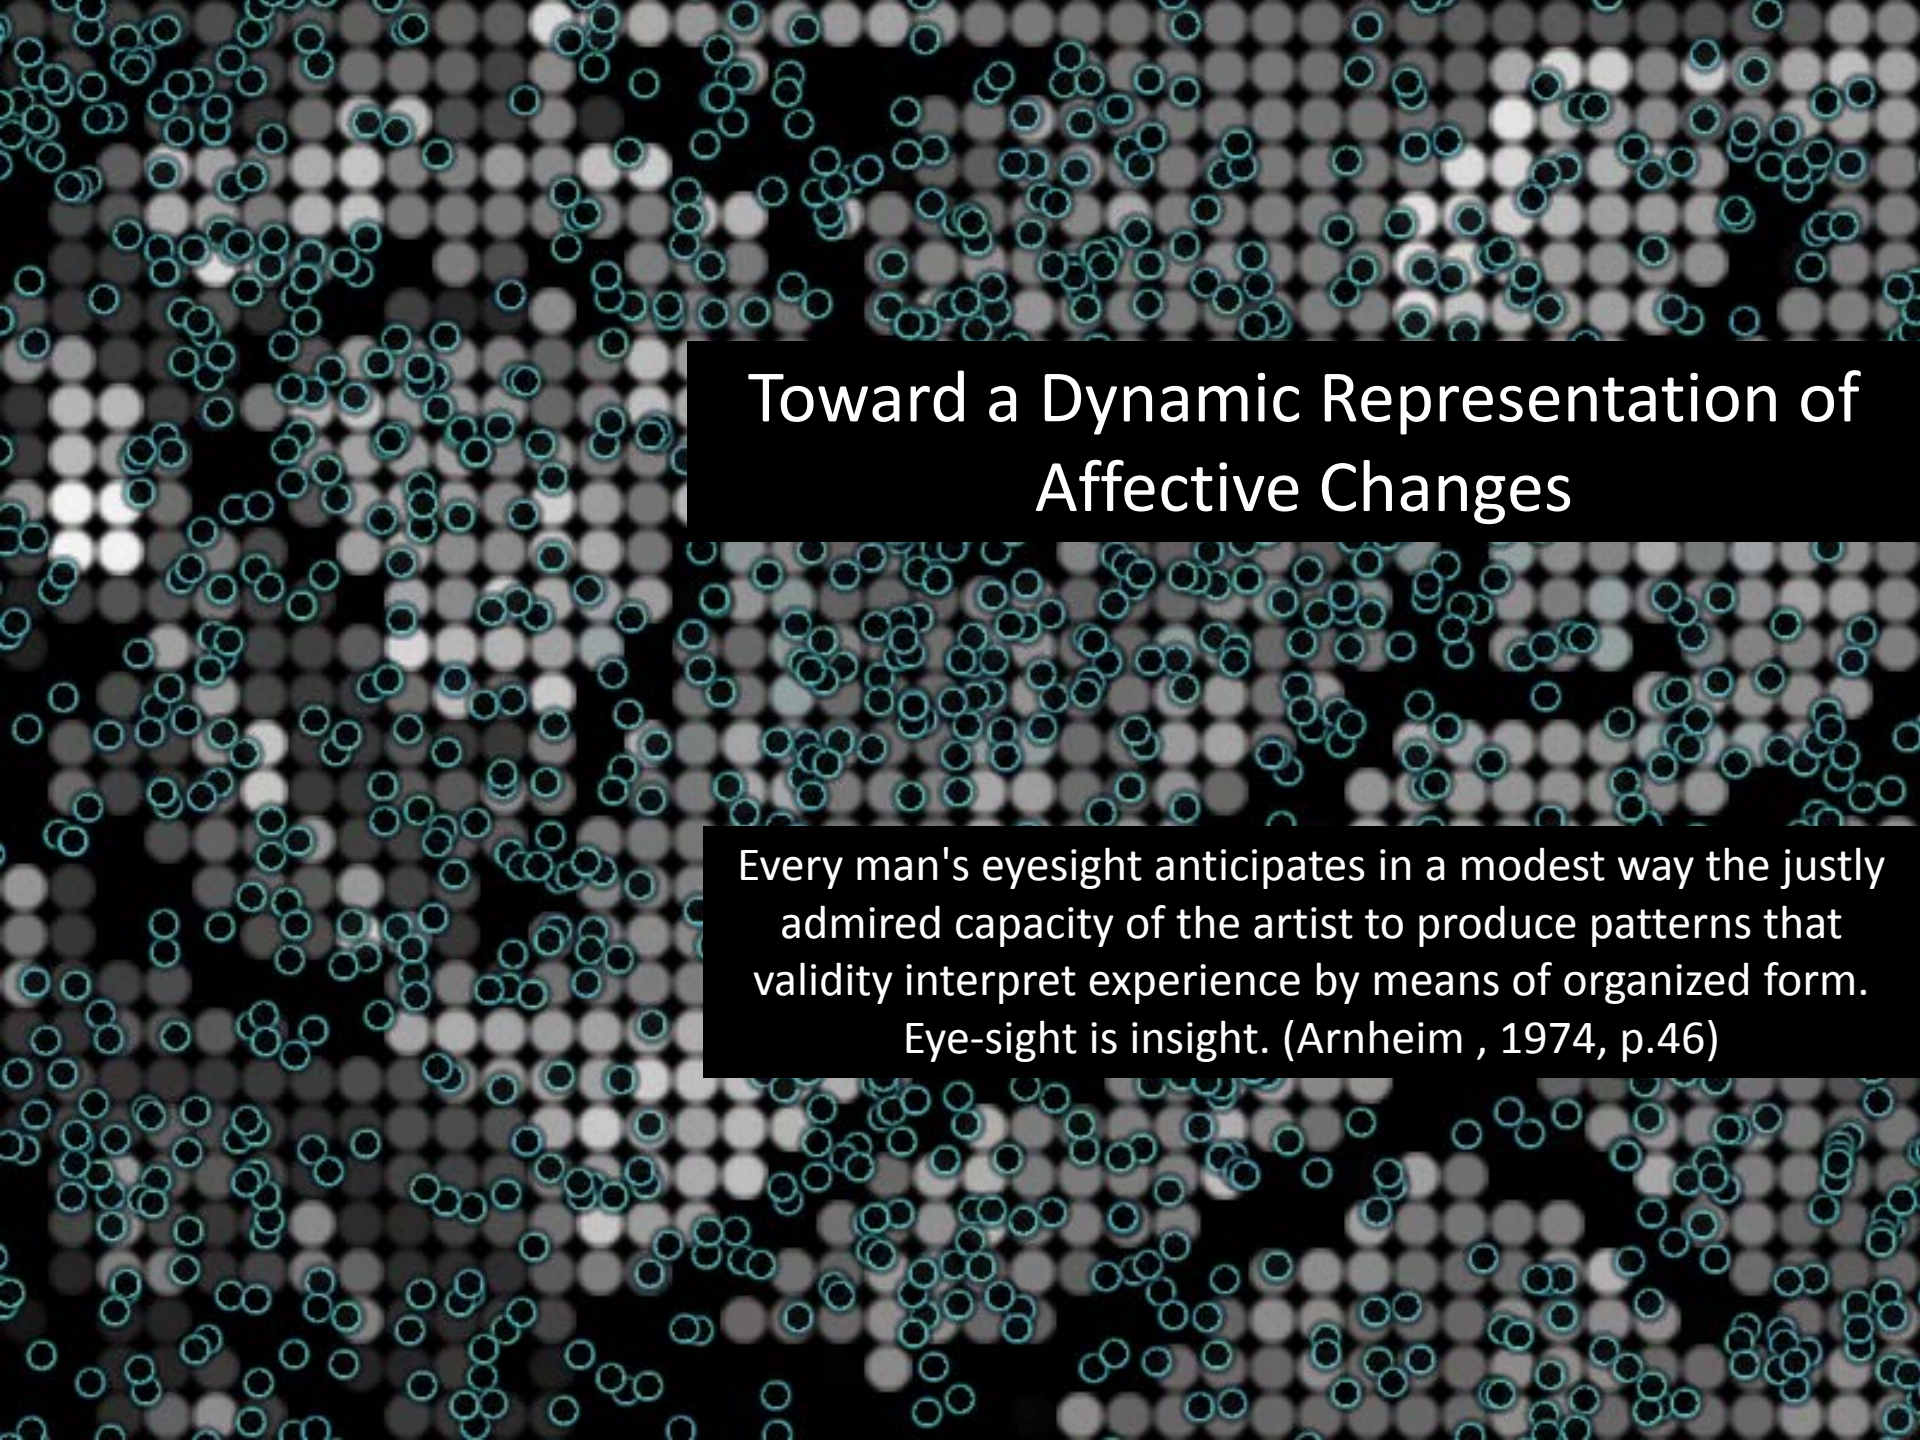

When observer asked to 'give the ages of the people' (see on the left) , their gaze where focused only on people whereas if they were asked to simply look at the picture ,many more fixation occurred also in different areas (see on the right). The two images are an updated version of Yarbus' original images (Yarbus 1967, p.174) that now showing the image and scanpath in an overlap (Archibald, 2008)

The Affective Eye

Discrete Emotional States $\leftarrow \rightarrow$ Dynamic Capacity of the Embodied Eye

Toward a Dynamic Representation of Affective Changes

Every man's eyesight anticipates in a modest way the justly admired capacity of the artist to produce patterns that validity interpret experience by means of organized form.
Eye-sight is insight. (Arnheim , 1974, p.46)

Affective Interaction – Feedback Mechanism

- Dynamic changes in the pattern of the swarm reflect affective changes in the user – visual application of collective consciousness
- Swarm might follow or avoid the focus of the eye, which can be described as ‘predator’ or ‘guider’ behaviours.
→covert attention
- Task-driven interaction are when the user is asked to guide a swarm/ Smooth pursuit eye movements
- The particle system produces messages as affective texts or recognisable shapes with affective meaning

Swarm Intelligence: An Aesthetic Enquiry

This intelligent behaviour can be described as a form of 'swarm intelligence,' (Beni and Wang 1989) designed to visualise the natural phenomena of fish shoals, bird flocks and swarms of insects.

Swarm Intelligence: An Aesthetic Enquiry

The particular patterns appointed to the changes in the user's evaluated affective states.

fish shoal patterns is appointed to low engagement level

bird flocks to optimal performance and

insect swarm behaviour to erratic engagement level.

Large Display controlled by Eye Tracking

Eye Tracking Adjustment and Calibration

Affective Modeling of the User

aesthetic exploitation of the feedback mechanism between technological effect and affective human responds

The affective modelling of the user is based on three characteristics:

- aesthetic engagement with the screen (level of engagement), task driven interaction
 - (as level of attention, engagement, performance) user's affective responses over time
 - Involuntary responses as eyelid movements (blink rate, blink closure duration)
